

A framework for 3D nonlinear analysis of reinforced concrete frames under general loading

Introduction

- Tool for nonlinear analysis of 3D frame reinforced concrete structures under **general load conditions**.
- Simulation of **different failure modes** (shear, torsion, bending, axial and coupled)
- Plastic-damage 3D constitutive with evolutive dilatancy for concrete.
- B-Spline sectional model with total interaction.
- Force based frame element with different order sectional models at the integration points.

Framework and models

Structural Level

$Q D K$

Element Level

$q d K_e$

$\sigma \epsilon C$

Material Level

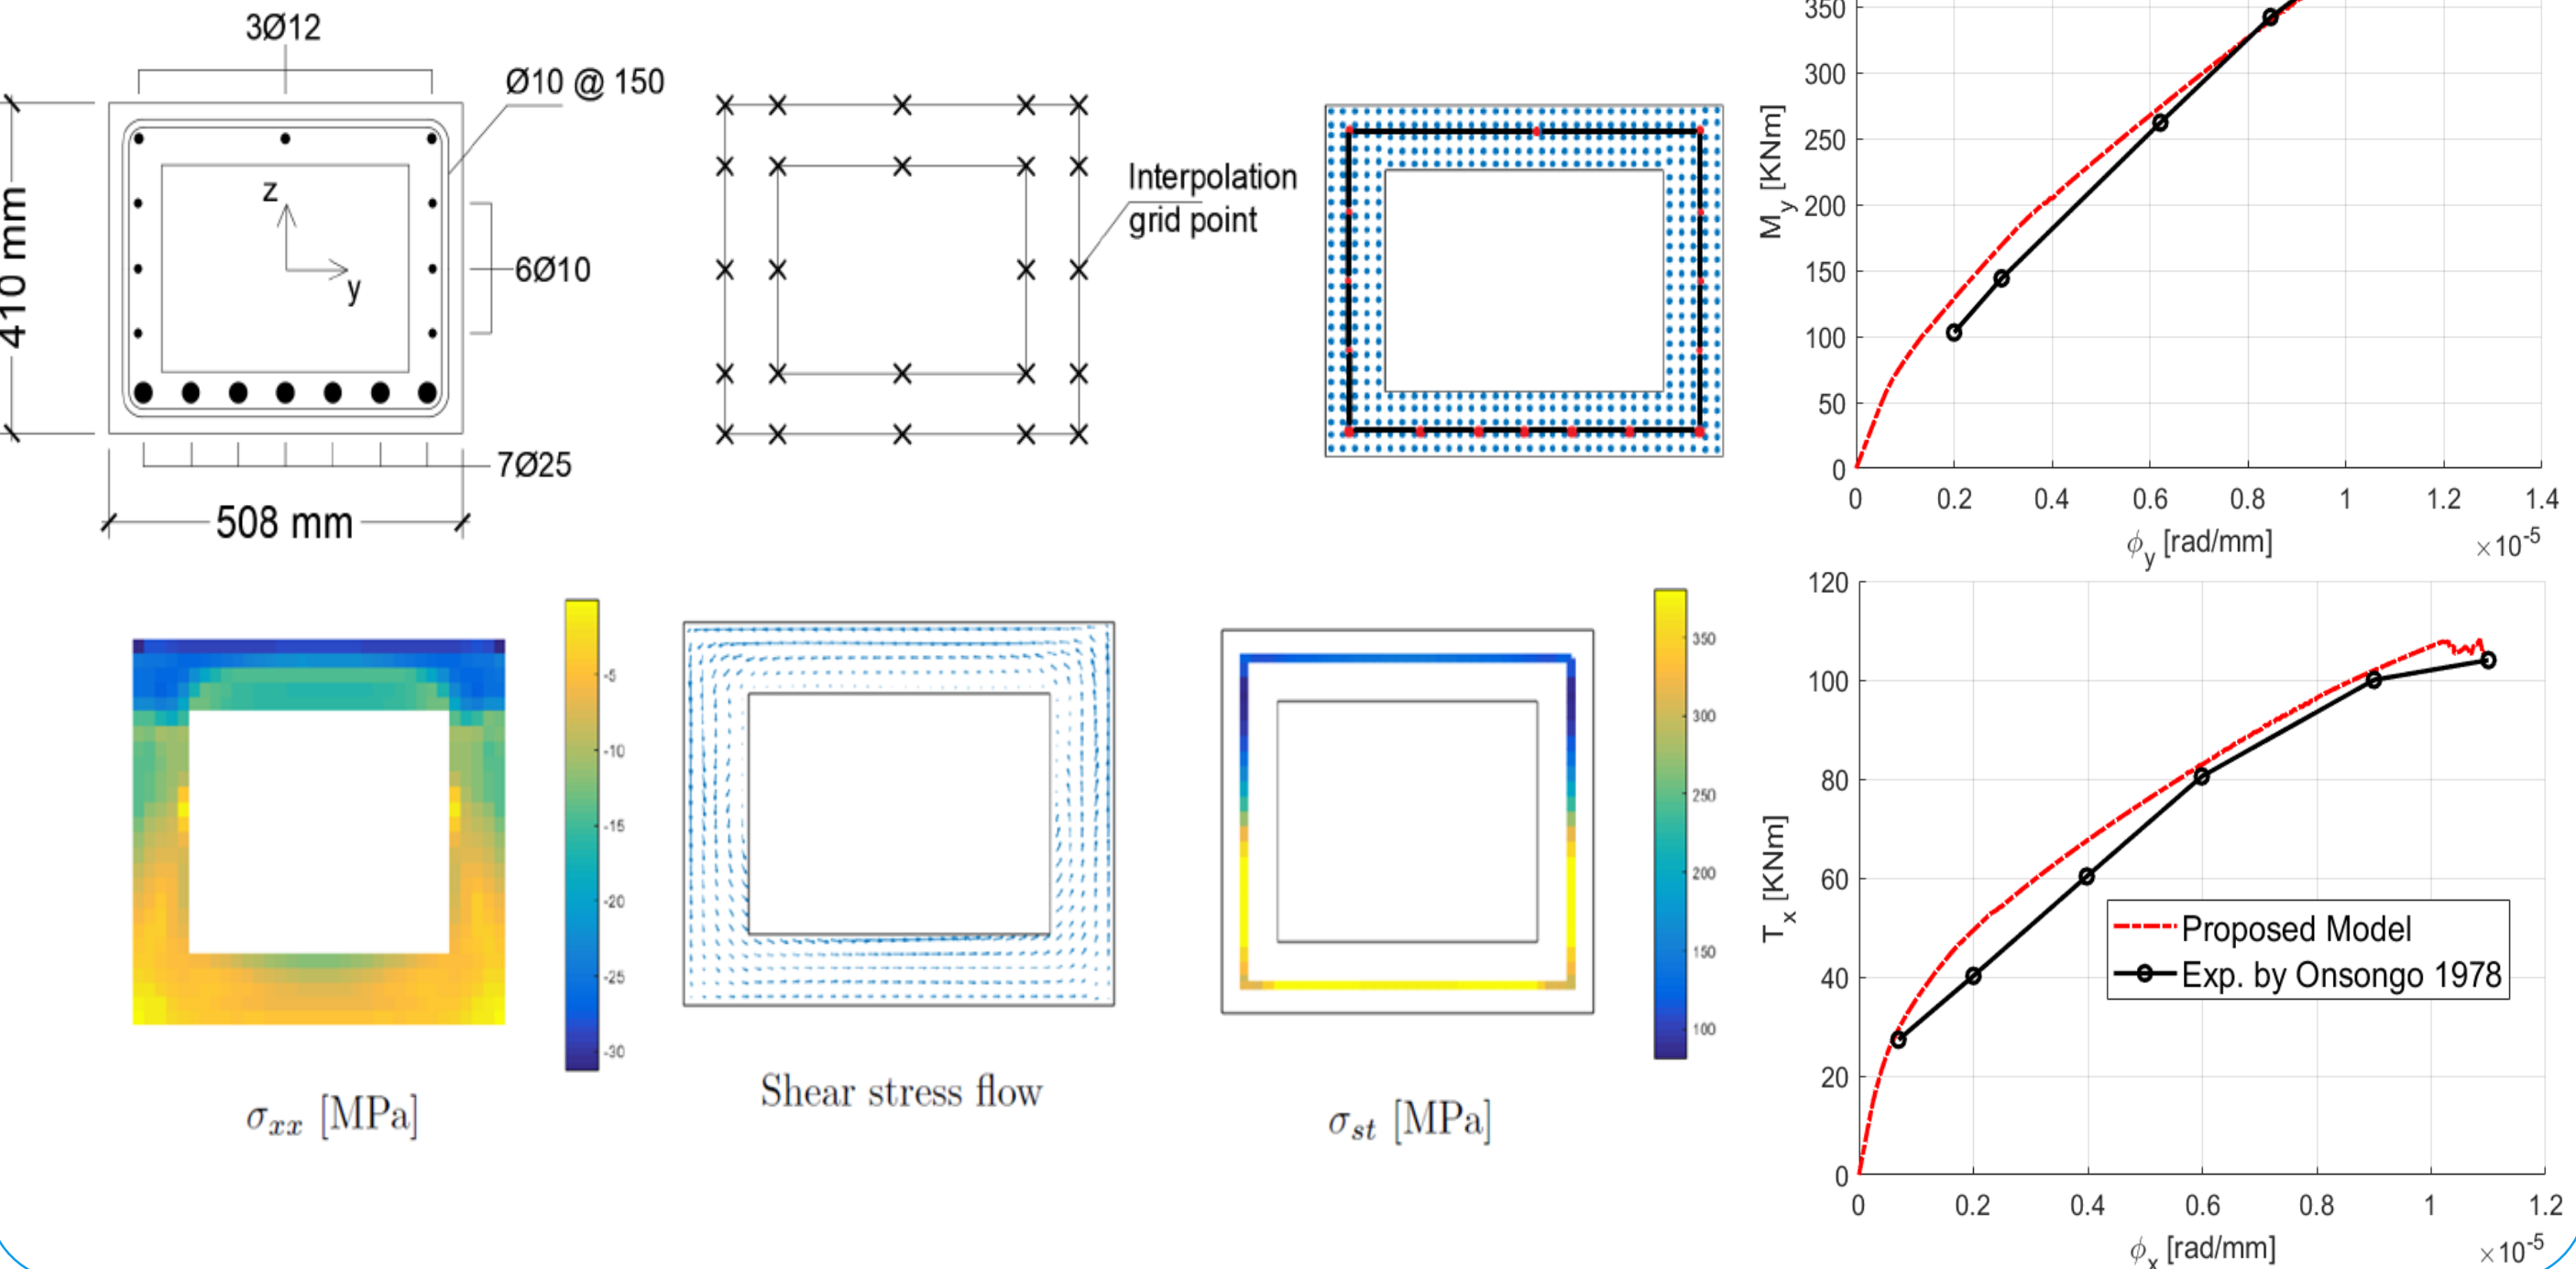

$s_s e_s K_s$

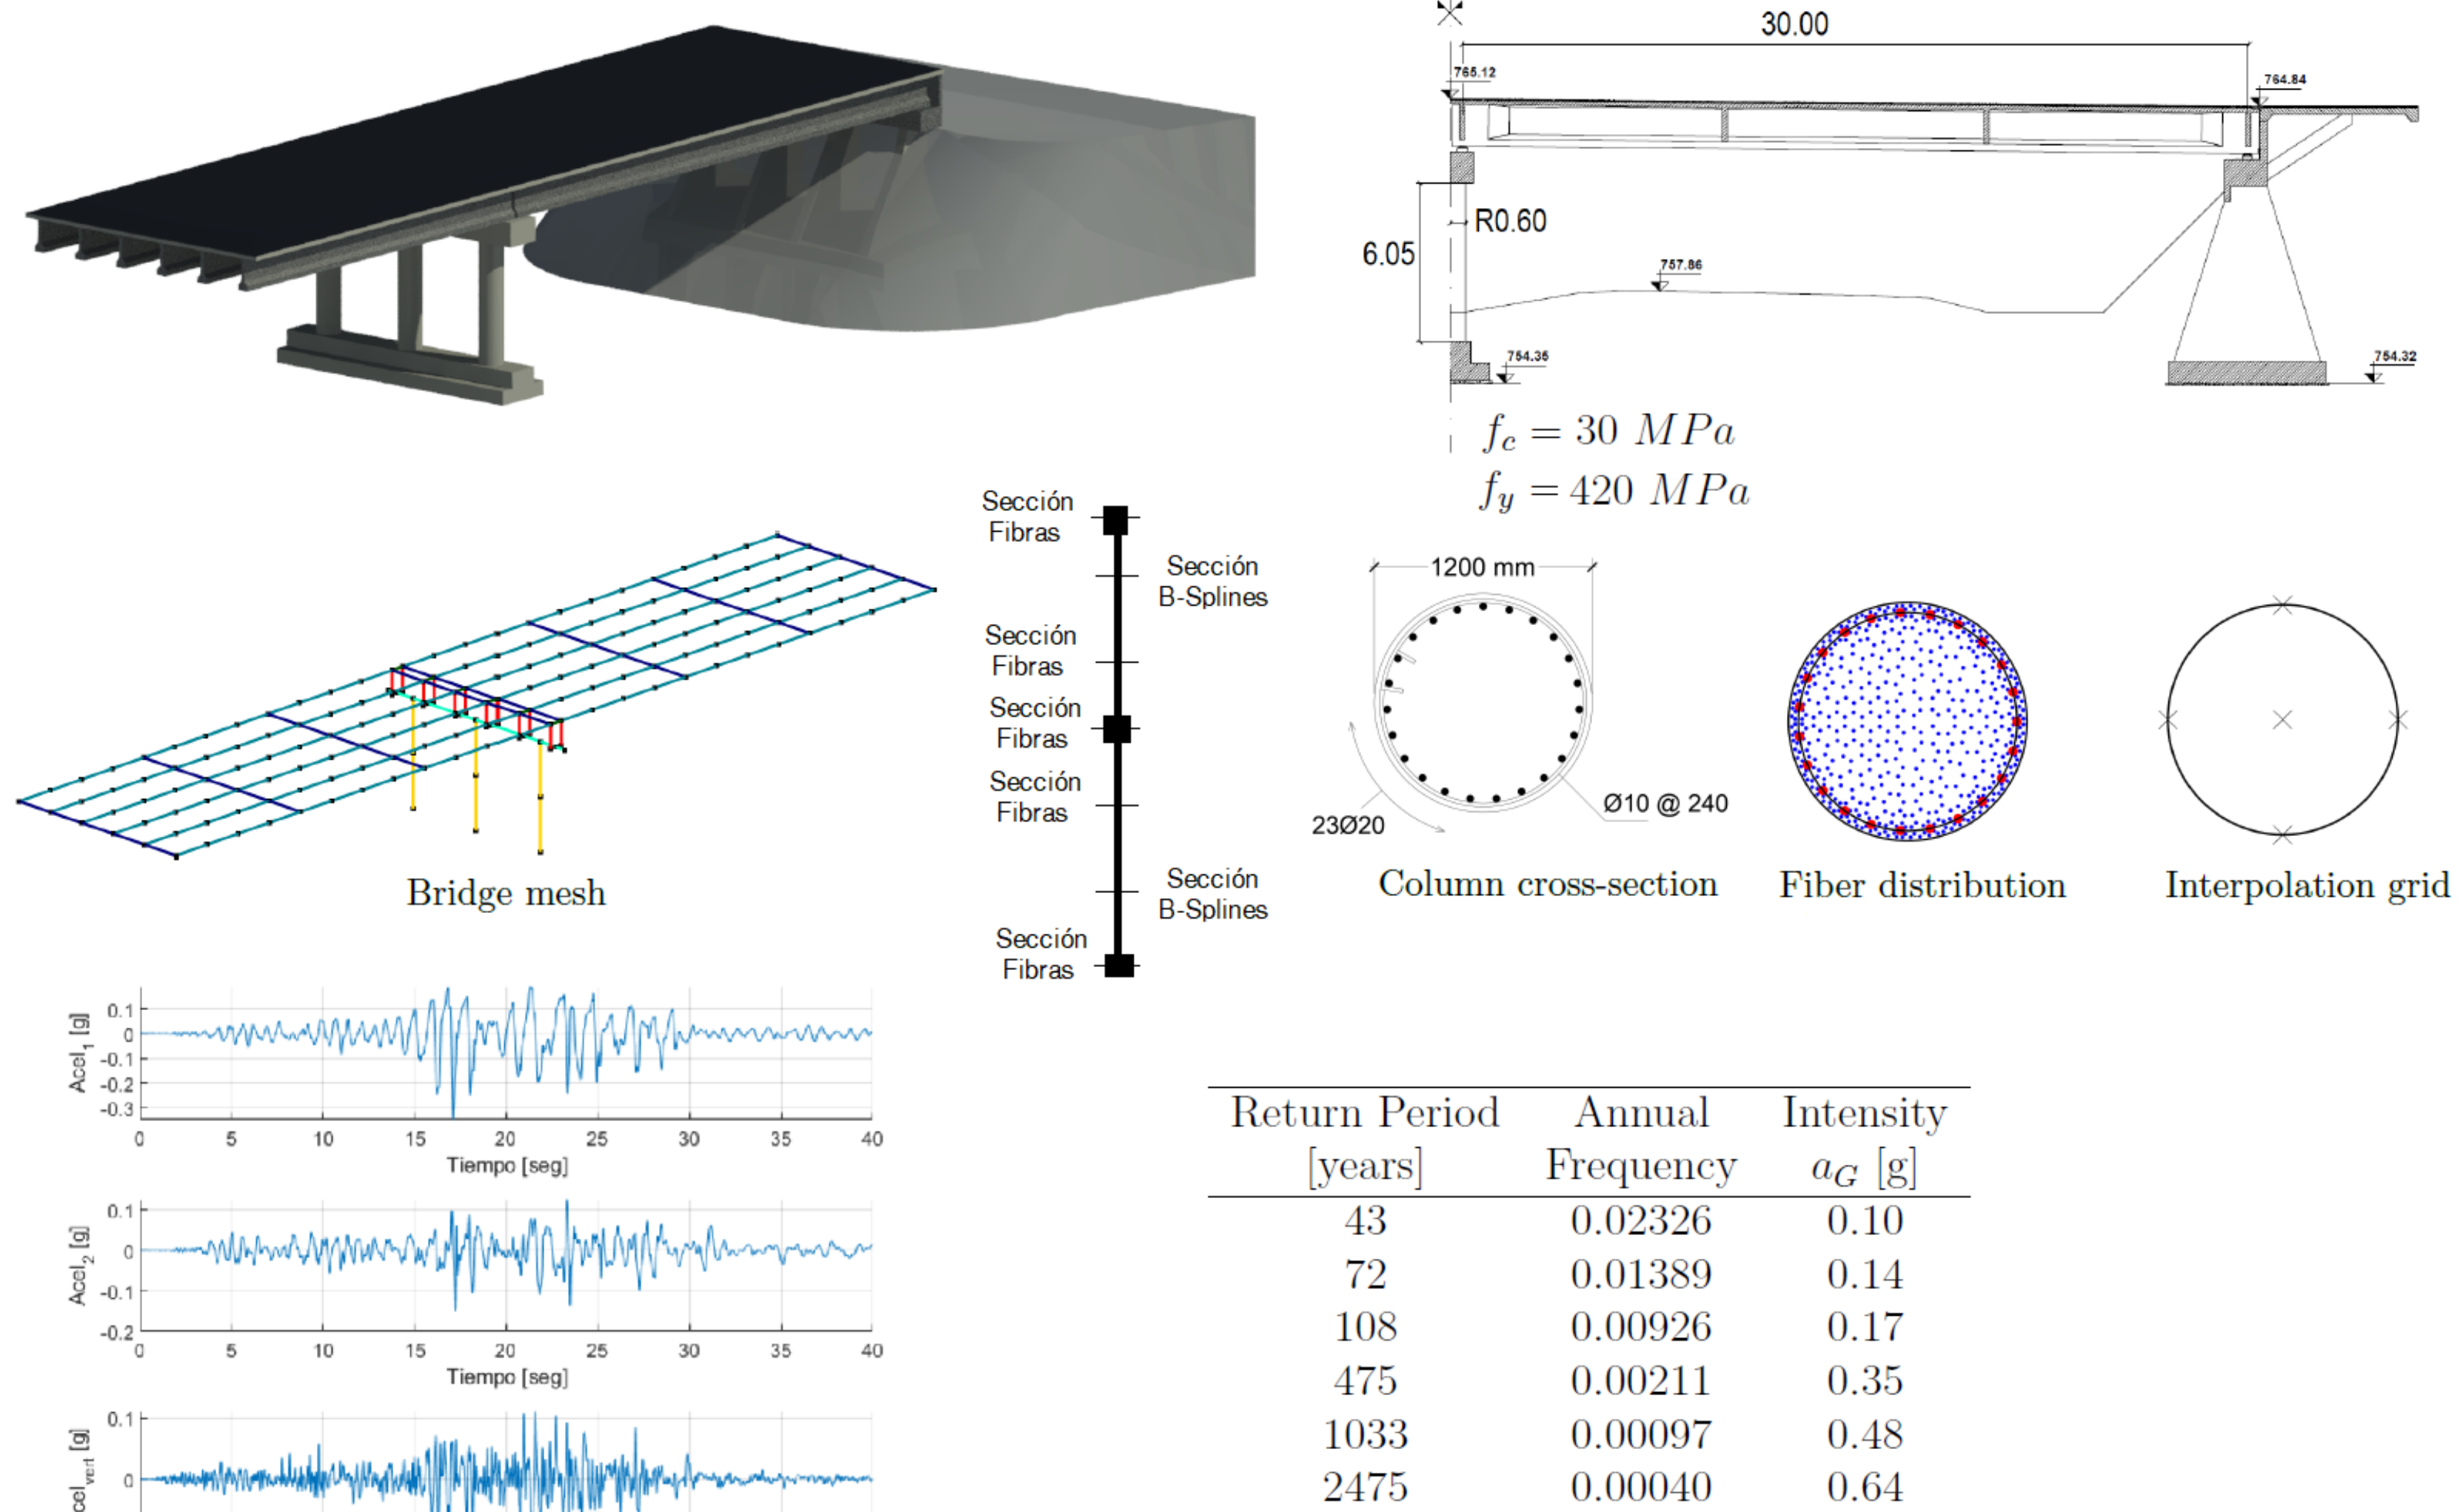

Sectional Level

Coupled torsion and bending

Seismic Performance of a Bridge

Coupled shear and bending
