

# Modelling, Simulation and Control in Key Technologies

Volker Mehrmann

TU Berlin, Institut für Mathematik

**DFG Research Center MATHEON**  
*Mathematics for key technologies*

- 1 Introduction
- 2 MATHEON
- 3 Real world applications
- 4 Linear systems
- 5 Eigenvalue problems
- 6 Conclusions

Wouldn't it be nice, if

- ▶ our heating system makes our apartment nice and comfortable and a same time the energy resources are significantly reduced;
- ▶ our airplane flies through a turbulence and we don't notice;
- ▶ a high-speed train goes by our house and we don't hear it;
- ▶ the public transport system is always on time;
- ▶ our car makes less noise, uses less gas and produces less  $CO_2$ ;
- ▶ our computers get faster every year and have more storage;
- ▶ fatal traffic accidents are avoided by automated help systems;
- ▶ . . . .

- ▶ Our engineers have built cars, airplanes, bridges, skyscrapers, chips, plants . . . for ages.
- ▶ Most engineers get away with the math from the first year.
- ▶ For the solution of differential equations, eigenvalue problems, optimization problems, there are wonderful commercial packages? **They always deliver good solutions.**
- ▶ If the problems become more complex then we just buy a bigger computer.
- ▶ **We don't really need mathematics** except as language for describing the models.
- ▶ **And the mathematicians don't really help, they spent their time looking for the zeroes of the Riemann Zeta-function.**
- ▶ **Optimization?** We just use genetic algorithms, they always find the optimal solution.

## **No technological development without modern mathematics!** We need:

- ▶ Very good mathematical models, that represent the technological process well.
- ▶ Deep understanding of the models and the dynamics of the processes.
- ▶ Accurate and efficient algorithms to simulate the models/processes.
- ▶ Accurate and efficient methods to control and optimize the processes and products.

- 1 Introduction
- 2 MATHEON**
- 3 Real world applications
- 4 Linear systems
- 5 Eigenvalue problems
- 6 Conclusions

- ▷ DFG Research center funded since June 2002.
- ▷ **Mathematics for key technologies: Modelling, simulation, and optimization of real world processes.**
- ▷ Participating institutions: TU Berlin, HU Berlin, FU Berlin, Weierstraß Institut (WIAS), Konrad Zuse Institut Berlin (ZIB).
- ▷ Funding volume, approx. 5.5 Mio Euro per year from DFG, 3 Mio per year from the research institutions and more than 7 Mio extra outside funding with about half from industry.
- ▷ Approx. 60 research projects.
- ▷ 45 math. professors.

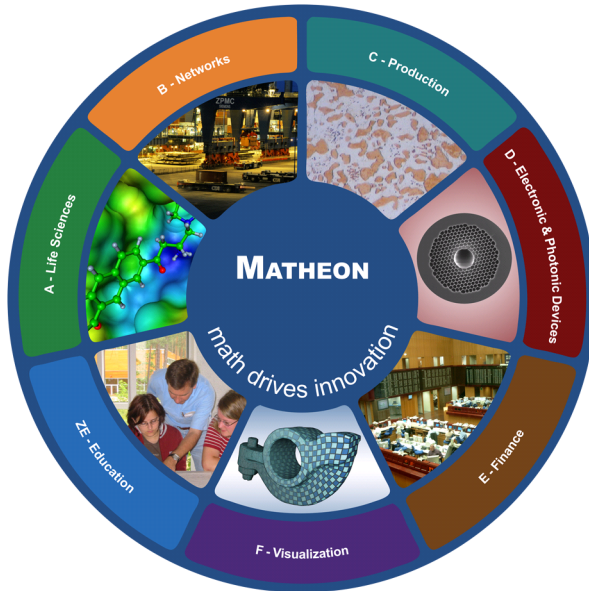

- ▶ Modern key technologies become more and more complex.
- ▶ Innovation cycles become shorter.
- ▶ Flexible mathematical models are the prerequisite to master complexity, to act fast and to find smart solutions.
- ▶ To derive such models needs abstractions.
- ▶ The language of abstraction is mathematics.
- ▶ But mathematics is not only a language. It creates value.

**Theoretical understanding, efficient algorithms, optimal solutions.**

# MATHEON application areas.

# What are (P)DAEs ?

**(Partial) differential-algebraic equations (DAEs), descriptor systems, singular differential eqns** are implicit systems of differential equations of the form

$$\begin{aligned}0 &= \mathcal{F}(t, \xi, u, \dot{\xi}, p, \omega), \\ y_1 &= \mathcal{G}_1(t, \xi, u, p, \omega), \\ y_2 &= \mathcal{G}_2(t, \xi, u, p, \omega),\end{aligned}$$

with  $F \in C^0(\mathbb{R} \times \mathbb{D}_\xi \times \mathbb{D}_u \times \mathbb{D}_{\dot{\xi}} \times \mathbb{D}_p \times \mathbb{D}_\omega, \mathbb{R}^\ell)$ ,  
 $G_i \in C^0(\mathbb{R} \times \mathbb{D}_\xi \times \mathbb{D}_u \times \mathbb{D}_p \times \mathbb{D}_\omega, \mathbb{R}^{p_i})$ ,  $i = 1, 2$ .

- ▷  $t \in \mathbb{I} \subset \mathbb{R}$  is the time,
- ▷  $\xi$  denotes the state (finite or infinite dimensional),  $\dot{\xi} = \frac{d}{dt}\xi$ ,
- ▷  $u$  denotes control inputs,  $\omega$  denotes uncertainties/disturbances,
- ▷  $y_1$  denotes controlled,  $y_2$  measured outputs,
- ▷  $p$  denotes parameters.

- 1 Introduction
- 2 MATHEON
- 3 Real world applications**
- 4 Linear systems
- 5 Eigenvalue problems
- 6 Conclusions

**Modeling, simulation and software control of automatic gearboxes.** Project with Daimler AG (Dissertation: Peter Hamann 2009) → film.

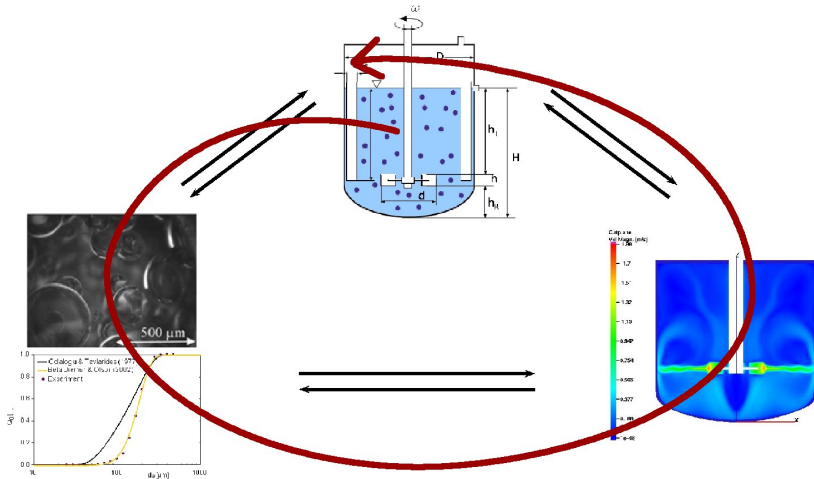

- ▶ Modeling of multi-physics model: multi-body system, elasticity, hydraulics, friction, . . . .
- ▶ Development of control methods for coupled system.
- ▶ Real time control of gearbox.

**Goal: Decrease full consumption, improve switching**  
**Large hybrid multi-physics control system (PDAE)**

# Drop size distributions

with M. Kraume (Chemical Eng., TU Berlin), M. Schäfer (Mech. Eng. TU Darmstadt)

## Chemical industry: pearl polymerization and extraction processes

- ▶ Modeling of coalescence and breakage in turbulent flow.
- ▶ Numerical methods for simulation of coupled system of population balance equations/fluid flow equations. → film.
- ▶ Development of optimal control methods for large scale coupled systems
- ▶ Model reduction and observer design.
- ▶ Feedback control of real configurations via stirrer speed.

**Goal:** Achieve specified average drop diameter and small standard deviation for distribution by real time-control of stirrer-speed.

- ▷ Navier Stokes equation (flow field)
- ▷ Population balance equation (drop size distribution).
- ▷ One or two way coupling.
- ▷ Initial and boundary conditions.

Space discretization leads to an extremely large control system of nonlinear DAEs.

## Project in Sfb 557 Control of complex shear flows, with F. Tröltzsch, M. Schmidt

## Control of detached turbulent flow on airline wing

- ▶ Test case (backward step to compare experiment/numerics.)
- ▶ modeling of turbulent flow.
- ▶ Development of control methods for large scale coupled systems.
- ▶ Model reduction and observer design.
- ▶ Optimal feedback control of real configurations via blowing and sucking of air in wing.

**Ultimate goal:** Force detached flow back to wing.

## Movement of recirculation bubble following reference curve.

## Classical applications of (P)DAE modeling.

- ▶ Electronic circuit simulation (Kirchhoff's laws).
- ▶ Simulation and control of mechanical multi-body systems (position or velocity constraints).
- ▶ Flow simulation and flow control (mass conservation).
- ▶ Metabolic networks (balance equations).
- ▶ Simulation and control of systems from chemical engineering (mass balances).
- ▶ Simulation and control of traffic systems (mass conservation).
- ▶ ...

**(P)DAEs provide a unified framework for the analysis, simulation and control of (coupled) dynamical systems (continuous and discrete time).**

- ▶ **Automatic modeling leads to DAEs.** (Constraints at interfaces).
- ▶ Conservation laws lead to DAEs. (Conservation of mass, energy, momentum).
- ▶ Coupling of solvers leads to DAEs (discrete time).
- ▶ Control problems are DAEs (behavior).

Figure: A mechanical multibody system

- ▶ Mass point with mass  $m$  in Cartesian coordinates  $(x, y)$  moves under influence of gravity in a distance  $l$  around the origin.
- ▶ Kinetic energy  $T = \frac{1}{2}m(\dot{x}^2 + \dot{y}^2)$
- ▶ potential energy  $U = mgy$ , where  $g$  is the gravity constant,
- ▶ Constraint equation  $x^2 + y^2 - l^2 = 0$ ,
- ▶ Lagrange function  $L = \frac{1}{2}m(\dot{x}^2 + \dot{y}^2) - mgy - \lambda(x^2 + y^2 - l^2)$
- ▶ Equations of motion

$$\frac{d}{dt} \left( \frac{\partial L}{\partial \dot{q}} \right) - \frac{\partial L}{\partial q} = 0$$

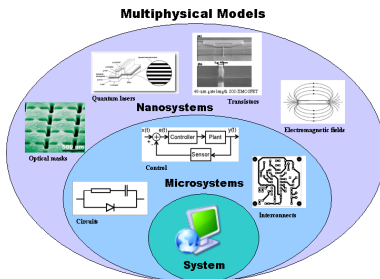

for the variables  $q = x, y, \lambda$ , i. e.,

- ▶ DAE model:

$$\begin{aligned} m\ddot{x} + 2x\lambda &= 0, \\ m\ddot{y} + 2y\lambda + mg &= 0, \\ x^2 + y^2 - l^2 &= 0. \end{aligned}$$

## DAE modeling is standard in multi-physics systems.

Packages like MATLAB (SIMULINK), DYMOLA (MODELLICA) and SPICE like circuit simulators proceed as follows:

- ▶ Modularized modeling of uni-physics components.
- ▶ Network based connection of components.
- ▶ Identification of input and output parameters.
- ▶ Numerical simulation and control on full model.

## **Modeling becomes extremely convenient, but:**

- ▶ Numerical simulation does not always work, instabilities and convergence problems occur (e.g. SIMULINK) !
- ▶ Solution may depend on derivatives of input functions.
- ▶ Consistent initialization is difficult.
- ▶ The discretized system may be unsolvable even if the DAE is solvable and vice versa.
- ▶ Numerical drift-off phenomenon.
- ▶ Model reduction is difficult.
- ▶ Classical control is difficult (non-proper transfer functions).

**Black-box DAE modeling pushes all difficulties into the numerics. In general the methods cannot handle this!**

We use derivative arrays (Campbell 1989).

We assume that derivatives of original functions are available or can be obtained via computer algebra or automatic differentiation.

Linear case: We put  $E(t)\dot{x} = A(t)x + f(t)$  and its derivatives up to order  $\mu$  into a large DAE

$$M_k(t)\dot{z}_k = N_k(t)z_k + g_k(t), \quad k \in \mathbb{N}_0$$

for  $z_k = (x, \dot{x}, \dots, x^{(k)})$ .

$$M_2 = \begin{bmatrix} E & 0 & 0 \\ A - \dot{E} & E & 0 \\ \dot{A} - 2\ddot{E} & A - \dot{E} & E \end{bmatrix}, \quad N_2 = \begin{bmatrix} A & 0 & 0 \\ \dot{A} & 0 & 0 \\ \ddot{A} & 0 & 0 \end{bmatrix}, \quad z_2 = \begin{bmatrix} x \\ \dot{x} \\ \ddot{x} \end{bmatrix}.$$

# Derivative arrays, nonlinear problems

Analogous approach for  $F(t, x, \dot{x}) = 0$  yields derivative array:

$$0 = F_k(t, x, \dot{x}, \dots, x^{(k+1)}) = \begin{bmatrix} F(t, x, \dot{x}) \\ \frac{d}{dt} F(t, x, \dot{x}) \\ \dots \\ \frac{d^k}{dt^k} F(t, x, \dot{x}) \end{bmatrix}.$$

We set

$$\begin{aligned} M_k(t, x, \dot{x}, \dots, x^{(k+1)}) &= F_{k;\dot{x}, \dots, x^{(k+1)}}(t, x, \dot{x}, \dots, x^{(k+1)}), \\ N_k(t, x, \dot{x}, \dots, x^{(k+1)}) &= -(F_{k;x}(t, x, \dot{x}, \dots, x^{(k+1)}), 0, \dots, 0), \\ z_k &= (t, x, \dot{x}, \dots, x^{(k+1)}). \end{aligned}$$

**Hypothesis:** There exist integers  $\mu$ ,  $r$ ,  $a$ ,  $d$ , and  $v$  such that  $\mathbf{L} = F_{\mu}^{-1}(\{0\}) \neq \emptyset$ .

We have  $\text{rank } F_{\mu; t, x, \dot{x}, \dots, x^{(\mu+1)}} = \text{rank } F_{\mu; x, \dot{x}, \dots, x^{(\mu+1)}} = r$ , in a neighborhood of  $\mathbf{L}$  such that there exists an equivalent system  $\tilde{F}(z_{\mu}) = 0$  with a Jacobian of full row rank  $r$ . On  $\mathbf{L}$  we have

1.  $\text{corank } F_{\mu; x, \dot{x}, \dots, x^{(\mu+1)}} - \text{corank } F_{\mu-1; x, \dot{x}, \dots, x^{(\mu+1)}} = v$ .
2.  $\text{corank } \tilde{F}_{x, \dot{x}, \dots, x^{(\mu+1)}} = a$  and there exist smooth matrix functions  $Z_2$  (left nullspace of  $M_{\mu}$ ) and  $T_2$  (right nullspace of  $\hat{A}_2 = \tilde{F}_x$ ) with  $Z_2^T \tilde{F}_{x, \dot{x}, \dots, x^{(\mu+1)}} = 0$  and  $Z_2^T \hat{A}_2 T_2 = 0$ .
3.  $\text{rank } F_{\dot{x}} T_2 = d$ ,  $d = \ell - a - v$ , and there exists a smooth matrix function  $Z_1$  with  $\text{rank } Z_1^T F_{\dot{x}} = d$ .

## Theorem (Kunkel/M. 2002)

*The solution set  $\mathbf{L}$  forms a (smooth) manifold of dimension  $(\mu + 2)n + 1 - r$ .*

*The DAE can locally be transformed (by application of the implicit function theorem) to a reduced DAE of the form*

$$\begin{aligned}\dot{x}_1 &= G_1(t, x_1, x_3), & (d \text{ differential equations}), \\ x_2 &= G_2(t, x_1, x_3), & (a \text{ algebraic equations}), \\ 0 &= 0 & (v \text{ redundant equations}).\end{aligned}$$

*The variables  $x_3$  represent undetermined components (controls).*

# General numerical simulation procedure

- ▶ Consistent initial values are obtained by solving  $F_\mu(t_0, x, \dot{x}, \dots, x^{(\mu+1)}) = 0$  at  $t_0$  for the algebraic variable  $(x, \dot{x}, \dots, x^{(\mu+1)})$ .
- ▶ For the integration of the DAE, e.g. with BDF methods, the system

$$\begin{aligned} F_\mu(t_0 + h, x, \dot{x}, \dots, x^{(\mu+1)}) &= 0, \\ \tilde{Z}_1^T F(t_0 + h, x, D_h x) &= 0 \end{aligned}$$

is solved for  $(x, \dot{x}, \dots, x^{(\mu+1)})$ .

- ▶ Here,  $\tilde{Z}_1$  denotes a suitable approximation of  $Z_1$  which projects onto the  $d$  differential equations at the desired solution, and

$$D_h x_i = \frac{1}{h} \sum_{l=0}^k \alpha_l x_{i-l},$$

is the discretization by BDF.

## Several production codes are available.

- ▶ Production code **GELDA** Kunkel/M./Rath/Weickert 1998 (linear variable coefficients), uses BDF and Runge–Kutta discretization.
- ▶ Production code **GENDA** (nonlinear regular), Kunkel/M./Seufer 2002 based on BDF.
- ▶ Matlab code **SOLVEDAE** (nonlinear), Kunkel/Mehrmann/Seidel 2005.
- ▶ Special multi-body code **GEOMS** Steinbrecher 2006.
- ▶ Circuit codes, joint with NEC, Bächle, Ebert, 2006.

Project with company SFE in Berlin **2007/2009**.

- ▶ Computation of acoustic field for coupled system of car body and air.
- ▶ SFE has its own parameterized FEM model which allows geometry and topology changes. (→ film)
- ▶ Frequent solution of linear systems and nonlinear eigenvalue problems (up to size 10, 000, 000) is needed within optimization loop that changes geometry, topology, damping material, etc.
- ▶ Ultimate goal: Minimize noise in important regions in car interior.

# Frequency response: Linear system

Solve  $P(\omega, \alpha)u(\omega, \alpha) = f(\omega, \alpha)$ , where

$$P(\omega, \alpha) := -\omega^2 \begin{bmatrix} M_s & 0 \\ 0 & M_f \end{bmatrix} + i\omega \begin{bmatrix} D_s & D_{as}^T \\ D_{as} & D_f \end{bmatrix} + \begin{bmatrix} K_s(\omega) & 0 \\ 0 & K_f \end{bmatrix},$$

is complex symmetric of dimension up to 10,000,000,

- ▶  $M_s, M_f, K_f$  are real symm. pos. semidef. mass/stiffness matrices of structure and air,  $M_s$  is singular and diagonal,  $M_f$  is sparse.  $M_s$  is a factor 1000 – 10000 larger than  $M_f$ .
- ▶  $K_s(\omega) = K_s(\omega)^T = K_1(\omega) + iK_2$ .
- ▶  $D_s$  is a real damping matrix,  $D_f$  is complex symmetric.
- ▶  $D_{as}$  is real coupling matrix between structure and air.
- ▶ All or part of the matrices depend on geometry, topology and material parameters.

- ▶ Solve for a given set of parameters  $\alpha_i$ ,  $i = 1, 2, \dots$ , the linear system  $P(\omega)u(\omega, \alpha_i) = f(\omega, \alpha_i)$ , for  $\omega = 0, \dots, 1000\text{hz}$  in small frequency steps.
- ▶ The parameters  $\alpha_i$  are determined in a manual or automatic optimization process, i.e.  $\alpha_i$  and  $\alpha_{i+1}$  are typically close.
- ▶ Parallelization in multi-processor multi-core environment.
- ▶ Often many right hand sides (load vectors)  $f(\omega)$ .
- ▶ Accuracy goal: Relative residual  $10^{-6}$ .

- ▶ Problems are badly scaled and get increasingly ill-conditioned when  $\omega$  grows.
- ▶ For some parameter constellations the system becomes exactly singular with inconsistent right hand side.
- ▶ Direct solution methods work only out-of-core.
- ▶ Blocks of matrices are changed with  $\alpha$ .
- ▶ No multilevel or adaptive grid refinement is available, methods must be matrix based.

- 1 Introduction
- 2 MATHEON
- 3 Real world applications
- 4 Linear systems
- 5 Eigenvalue problems**
- 6 Conclusions

Consider nonlinear eigenvalue problem  $P(\lambda, \alpha)x(\alpha) = 0$ , where

$$P(\lambda, \alpha) := \lambda^2 \begin{bmatrix} M_s & 0 \\ 0 & M_f \end{bmatrix} + \lambda \begin{bmatrix} D_s & D_{as}^T \\ D_{as} & D_f \end{bmatrix} + \begin{bmatrix} K_s(\lambda) & 0 \\ 0 & K_f \end{bmatrix},$$

is **complex symmetric** and has dimension up to 10,000,000, and all coefficients depend on parameter vector  $\alpha$ . Tasks:

- ▶ Compute all eigenvalues in a given region of  $\mathbb{C}$  and associated eigenvectors.
- ▶ Project the problem into the subspace spanned by these eigenvectors (for given sets of parameters) (Model reduction).
- ▶ Solve the second order differential-algebraic system (DAE).
- ▶ Optimize the eigenfrequencies/acoustic field, w.r.t. the set of parameters.

# Difficulties and challenges

- ▶ We need to improve convergence and preconditioning.
- ▶ We need better linearization techniques.
- ▶ We need better perturbation and error analysis.
- ▶ We need multiple grids.
- ▶ We need adaptivity in mesh refinement, eigenvalue computation and optimization.
- ▶ The methods have to run as parallel methods on modern multi-core machines.

- 1 Introduction
- 2 MATHEON
- 3 Real world applications
- 4 Linear systems
- 5 Eigenvalue problems
- 6 Conclusions**

- ▶ Industrial applications lead to hard mathematical problems.
- ▶ Simulation and control of PDAEs.
- ▶ Large scale nonlinear eigenvalue problems within optimization loop.
- ▶ The mathematical theory and algorithms are still far from the needs in reality.
- ▶ Commercially available codes are not satisfactory.
- ▶ Industry is not interested in and does not pay for the analysis, convergence proofs, etc.
- ▶ Industrial production code development is a challenge.
