# 1 Instructions

## Before you begin:

The following instructions are provided by TU Delft and have been tested to work. However, we offer this manual as an addition service; neither ICT nor a Servicepoint will be able to assist you further. For Thunderbird support, you can visit the community at: [link](#)

## 1.1 Changes existing profile

Check the version of Thunderbird. It has to be equal or higher then version 77.0. b1. Otherwise an update is necessary

- Click with right mouse-button on the mailbox.
- Choose settings.
- Select server settings.
- Change server name to outlook.office365.com. Port 993.
- Connection security : SSL/TLS
- Authentication method: change to OAuth2

De server settings configuration will be:

## Server Settings

Server Type: IMAP Mail Server

Server Name: outlook.office365.com

Port: 993   Default: 993

User Name: jdoe@tudelft.nl

## Security Settings

Connection security: SSL/TLS 

Authentication method: OAuth2 

Outgoing Server Name (SMTP) stays smtp-a.tudelft.nl

We are using the TU smtp-a server, because Exchange online smtp traffic is not an excepted standard.

## SMTP Server

### Settings

Description: SMTP-A TU Delft

Server Name: smtp-a.tudelft.nl

Port: 465   Default:465

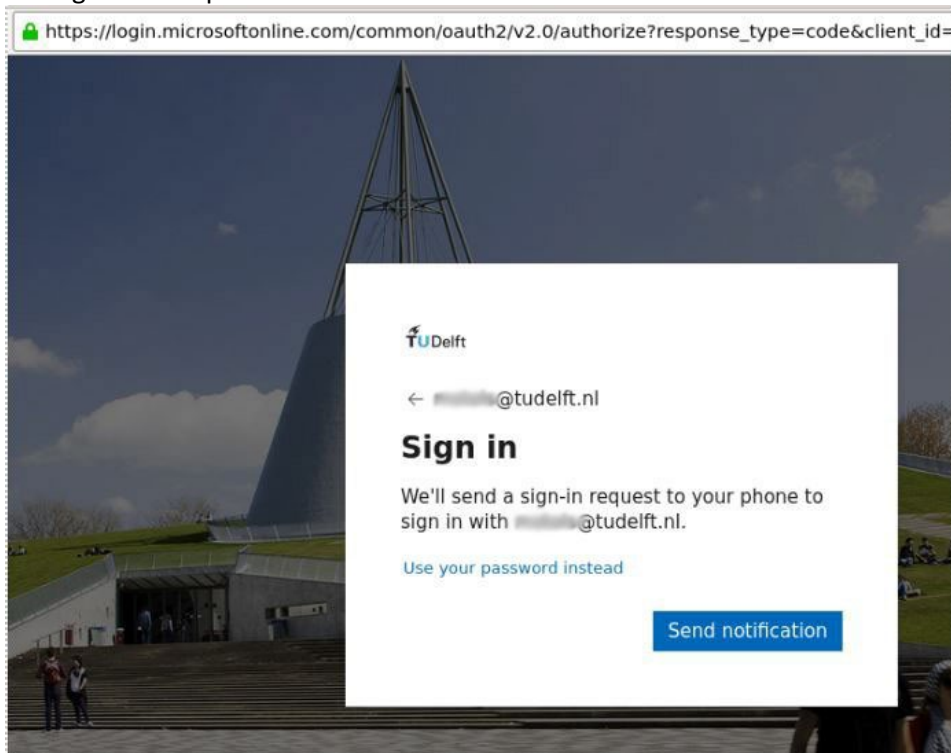

### Security and Authentication

Connection security: SSL/TLS

Authentication method: Normal password

User Name: jdoe@tudelft.nl

Because of the change of the authentication method to OAuth2 a connection to Exchange Online will be validated through the setup of the second factor.

Approve the login with the MS authenticator app or with the 2 factor code (TOTP/SMS) you have set.
