

YOGlove

APPLICATION OF SMART MATERIALS IN YOGA WEARABLES

Joint Innovation

The printed technology based wearable is the result of a fruitful collaboration of TU Delft and a leading innovation and research centre of Catalonia, CETEMMSA.

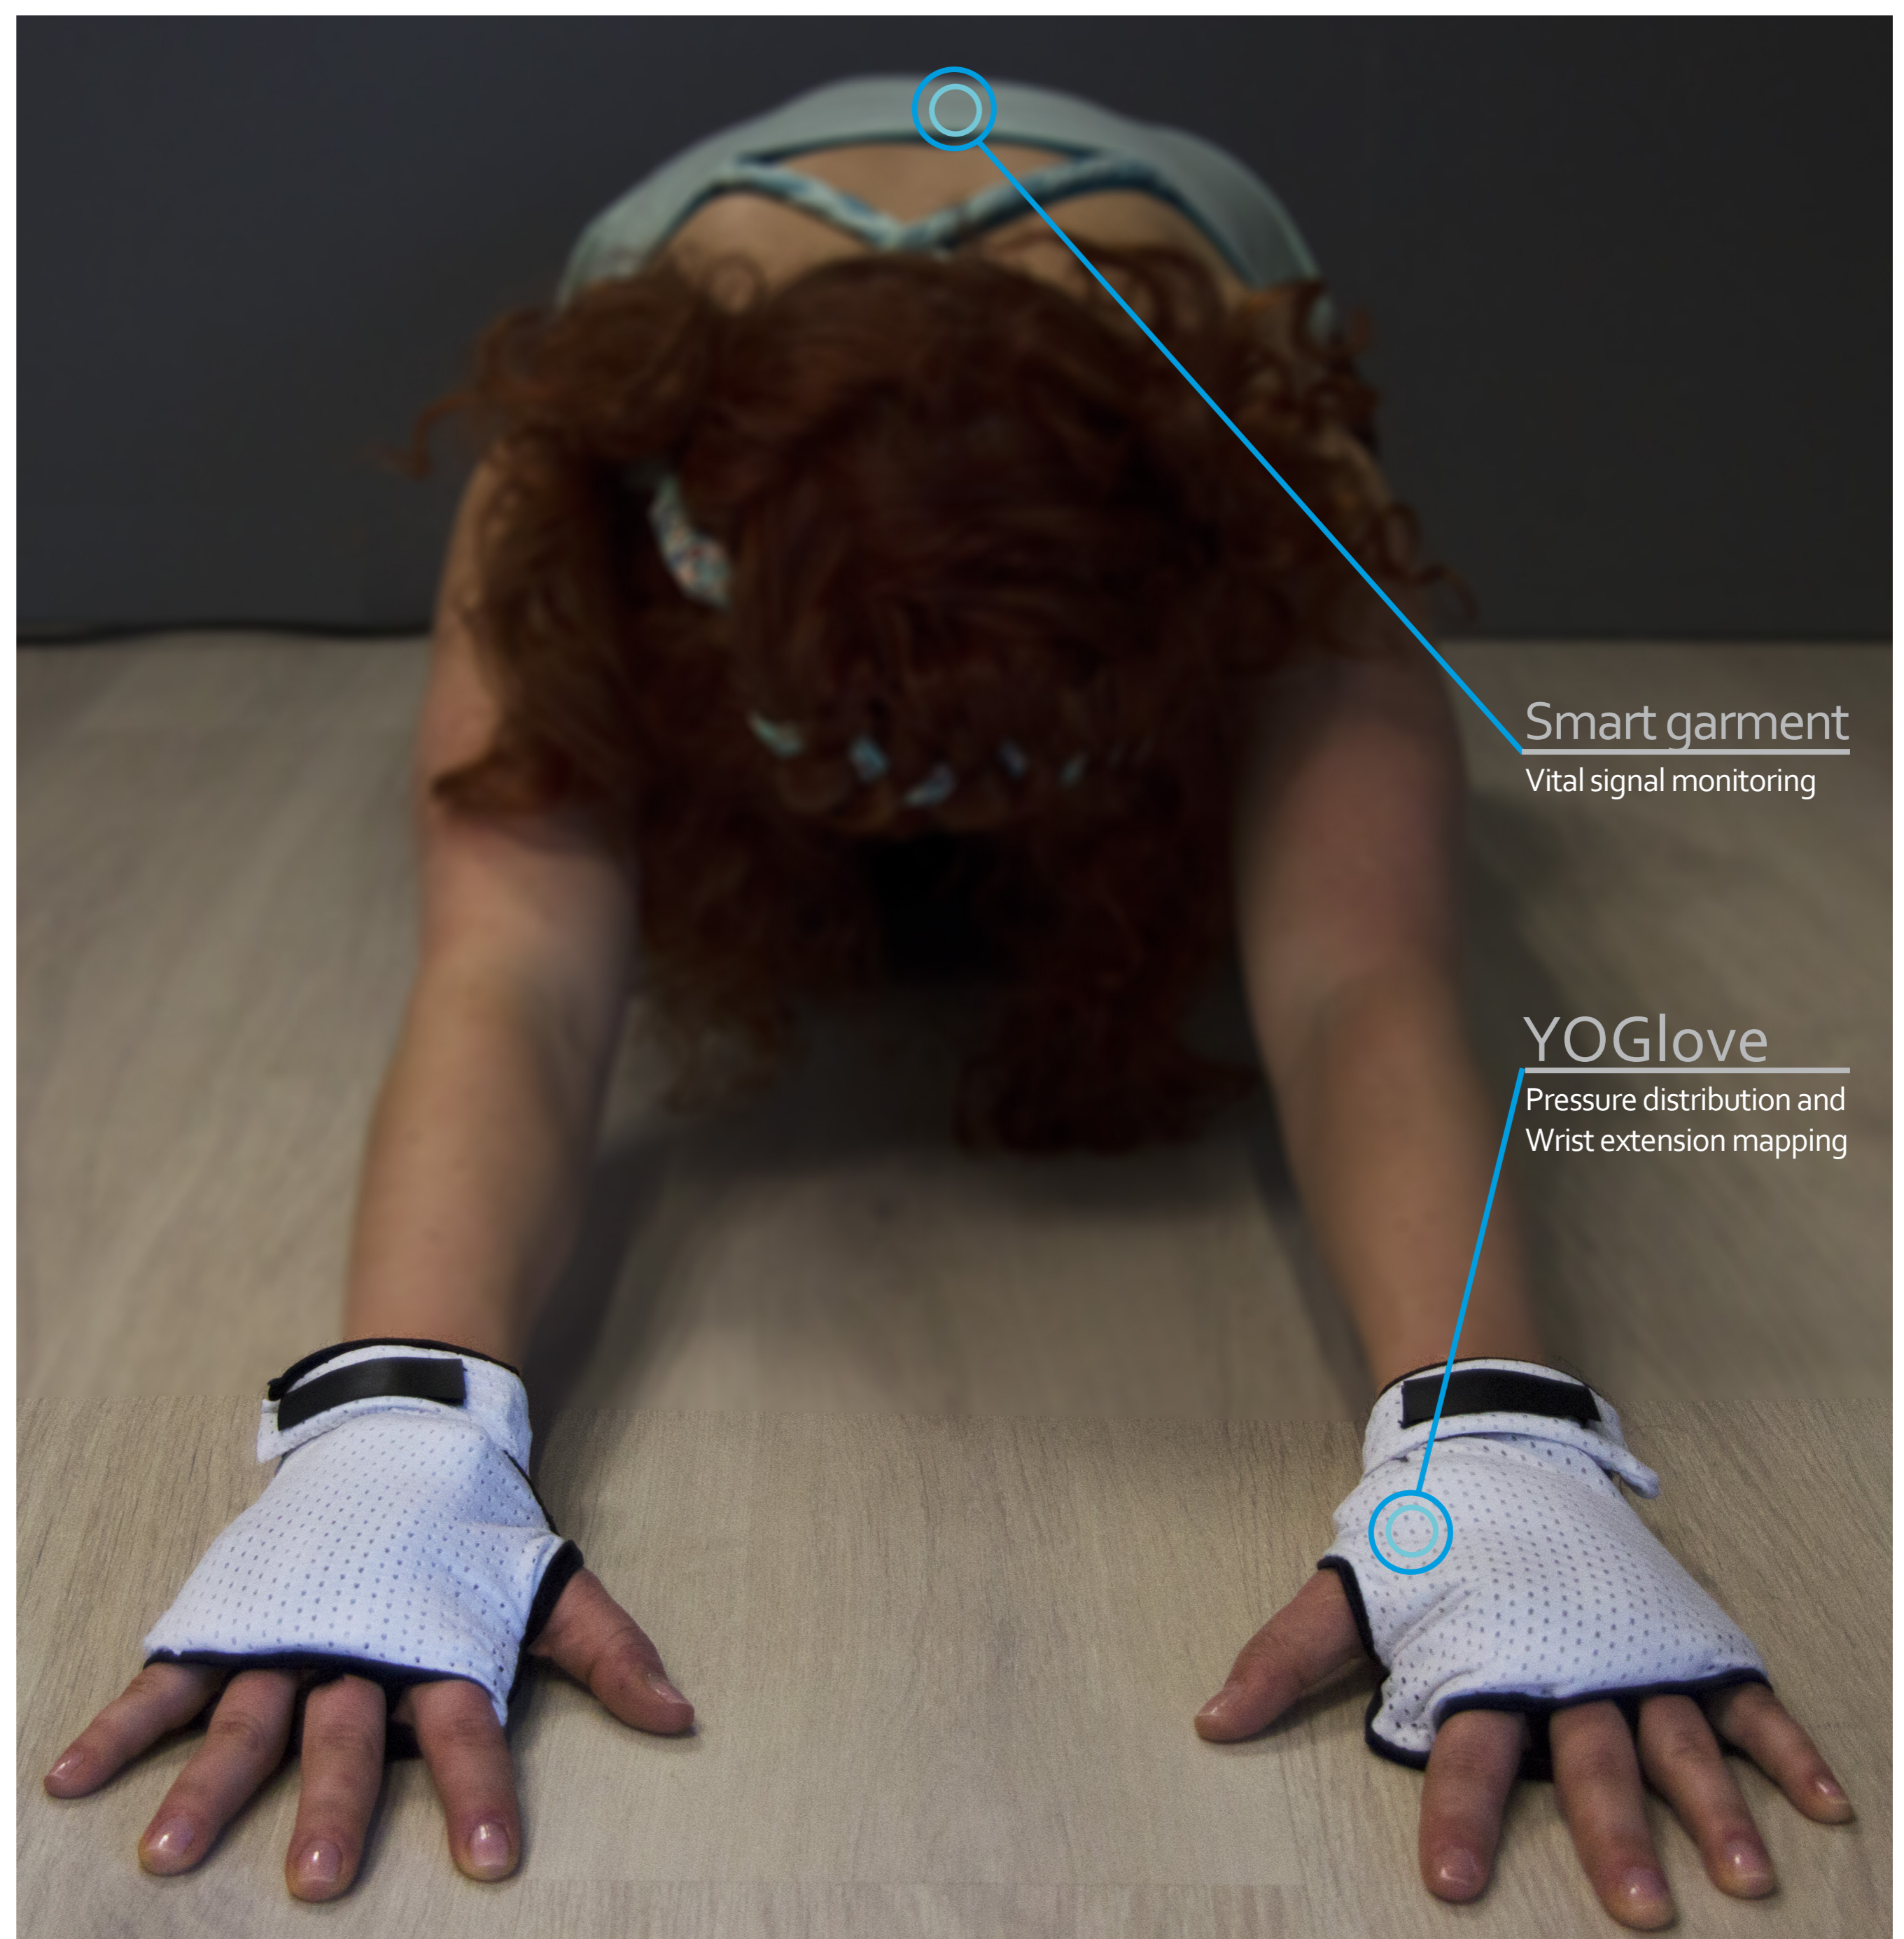

Vision

Utilizing printed light and sensors that are seamlessly integrated into a yoga wearable to avoid injuries and enhance the user experience. The main advantage lies in the intuitive real-time visual feedback system that gives subtle guidance while practicing. The product acts as a full-time yoga instructor promoting

anatomically correct poses for a safe and efficient practice. Besides creating a product with physical attributes, there is the aim of creating a link between science and traditional practice of yoga.

Science is progressing. Art is progressing. So yoga as being an art, a science, it has to progress.
