

Characteristics for a university study

The Board of Studies BSc Bouwkunde & MSc AUBS has defined a number of characteristics for a university study in general and for Architecture in particular.

In short, these mean:

- *knowledge multiplication*
the student comes to learn, the researcher develops knowledge further, on a personal and social level; innovation and rethinking play a major role
- *breadth and depth*
the Bachelor covers a wide range, the Master explores in depth
- *the connection between design and research*
designing takes place on the basis of insight and knowledge from research and research takes place partly on the basis of designs
- *the integral character of design*
central is "design in studio", where everything comes together, knowledge and skills are integrated and applied
- *conceptual thinking*
the concept is a statement, it creates unity, it makes a design strong and expressive and implies a number of rules for design
- *social pluriformity*
different views and opinions exist within the discipline, naming them creates clarity for a student to determine his place
- *sustainability*
the consequences of our way of living together require more sustainable actions and solutions if we want to continue to exist in a high-quality manner in the long term.
