

THESIS PROJECT & INTERNSHIP OPPORTUNITIES

Kinergizer is a high-tech company from Delft and a leader in supplying highbandwidth energy harvesters for IoT and low-power remote electronic devices. Kinergizer turns wireless sensors into powered by generating electricity from movement: for example, when a train moves over the track or a remote device shakes. This could save our planet billions of toxic batteries and our industry billions of euros in maintenance costs for replacing batteries. Batteries may not be expensive, but battery replacement is!

At Kinergizer we are looking for a an intern from the MSc track of MOT or related topics, to **conduct business development** analysis and **market deployment strategy** for our technology in a **new market**.

If you are interested in discussing possible projects, please contact us at <u>info@kinergizer.com</u> with the subject 'Thesis and Internship'.
