

# The new way of Learning on the Job

## a VR-Industry Practice

**Try the virtual practice in VR for a firsthand experience in the Demo Zone or discuss how VR could be applied on your education!**

For many engineering studies practical work assignments in industry where a common way to bring the young student into contact with the practical side of the work field. It offered a way to immerse yourself in the field and learn first hand about work practices, in our case ships and shipbuilding. Over time these assignments have been cancelled by studies for various reasons, time pressure, but also increased safety regulations are just a few. As a result, an important frame of reference has been lost to the student as experience is a powerful way to learn and understand a concept on which to stack further knowledge. Since 2020 the MT-Bachelor and VRZone have tried to counter this by creating a virtual practice in VR for students to at least get a feel for the work environment and practices. We are very excited to be able to finally share this with you.
