Electrons to High Value Chemical Products

In the E2C project 7 partners from the coastal areas of the 2 Seas region combine renewable energy with strong industrial activity. By the end of this project two highly flexible pilot demonstrators will be built for conversion of CO₂ with renewable energy and hydrogen to fuels and platform chemicals.

This will provide solutions to the challenges of:

- handling renewable energy surpluses
- diversifying feedstocks in the chemical industry
- reducing greenhouse gas emissions in energy intensive industry
- meeting societal and regulatory demands on advanced fuels and sustainable chemicals.

This project is also financed by:

Ministerie van Economische Zaken
